                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids and be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthaw, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the

administering at least one antianglogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antianglogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted anglogenesis. The method is useful for inhibiting anglogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial anglogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, anglofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antianglogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to inhibiting angiogenesis in a subject, comprising

New immunostimulatory oligonucleotide comprising non-palindromic nucleic acid sequence motif, useful for inducing B-cell activation, treating, preventing or ameliorating immune system disorder or tumoral disease e.g. melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ss; non-CpG; immunostimulatory; non-palindromic; immune response; proliferation; differentiation; cytokine; antibody production; B-cell; plasmacytoid dendritic cell; immunomodulator; gene therapy; chronic myelogenous leukaemia; melanoma; Kaposi's sarcoma; renal cell carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                           Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.

The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contect dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                        Immunostimulatory; antiinflammatory; dermatological; antipsoriatic; antiulcer; gene therapy; vaccine; non-allergic inflammatory disease; psoriasis; eczema; allergic contact dermatitis; latex dermatitis; inflammatory bowel disease; ulcerative colltis; Crohn's disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating non-allergic inflammatory diseases, such as psoriasis, ecz allergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA oligonucleotides (without a CpG motif), which can stimulate an immune response in animals of the order of primate, including humans. The immune response is characterised by the proliferation, differentiation, cytokine and antibody production in B-cells, as well as cell differentiation and cytokine production in B-cells, as well as cell differentiation and invention describes immunomodulator compositions that also comprise an antigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycoligids. As such, these DNA oligos can be used in generanellorating an immune system discorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell carcinoma. This oligonucleotide sequence is a non-CpG DNA oligo of the

(IMMU-) IMMUNOTECH SA

New immunostimulatory oligonucleotide comprising non-palindromic nucleic acid sequence motif, useful for inducing B-cell activation, treating, preventing or ameliorating immune system disorder or tumoral disease e.g. melanoma

Example 17; Page 81; 139pp; English.

This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA oligonucleotides (without a CpG motif), which can stimulate an immune response in animals of the order of primate, including humans. The immune

```
ö
response is characterised by the proliferation, differentiation, cytokine and antibody production in B-cells, as well as cell differentiation and cytokine production in plasmacytoid dendritic cells. The present invention describes immunomodulator compositions that also comprise an antigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipids. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or the manual disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell carcinoma. This oligonucleotide sequence is a non-CpG DNA oligo of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Bach of the nucleic acids further comprises a tag sequence. The array of nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                          Gape

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by pybridisation to a DNA library, in monitoring gene expression levels by pybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence in the method of analysis comprises the pybridising at least one or more nucleic acids to at least two or more nucleic acids probes and detecting the hybridisation. The nucleic acid gene expression levels, identifying biallelic markers or polymorphisms, gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison.

Sor family members of a gene and a cross-species comparison nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotable thybridisation to identify or detect the sequence or specific
                                                                                                                                                                                                                                                                                                                    ö
    probes is useful in in situ hybridisation, in Southern, Northern or dot-
blot hybridisation to identify or detect the sequence or specific
mutations of any gene, in mapping the 5' termini of mRNA molecules by
primer extensions or in screening cDNA or genomic libraries or subclones
for additional subclones containing segments of DNA that have been
isolated and previously sequenced. The sequence presented is one of the
nucleic acid probes incorporated in the microarray. Note: The sequence
data for this patent can also be obtained in electronic format directly
from USPTO at seqdata.uspto.goc/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
is useful in in situ hybridisation, in Southern, Northern or dot

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel isolated DNA molecule (I) which is expressed in stressed microspores and comprises a specific partial sequence of a DNA molecule with a length of 10-50 base pairs. The isolated DNA molecule is useful to transfect a plant and can be used as a general tool for causing male sterility in plants. It is also useful for producing a totipotent call or a male sterile plant. The present sequence
                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated DNA molecule that is expressed in stressed microspores, useful for causing male eterility in plants or for producing a totipotent
mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       tobacco; stressed microspore; plant; transfect; male sterility;
                                               isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at seqdata.uspto.goc/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                  The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequences have one or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (M) appB-100 levels or glucose-6-phosphatase levels in a subject; producing (I); involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of alsorder characterised by elevated or otherwise unwanted levels of levels of lipid metabolism. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                              antilipemic; cardiant; vasotropic; antiarteriosclerotic; antidiabetic; cytostatic; anticonvulsant; nootropic; muscula; anti-HIV; RNA interference; iRNA; antieense technology; lipid metabolism; cholesterol imbalance; dyslipidaemia hypercholesterolaemia; coronary artery disease; CAD; coronary heart disease; CHD; atherosclerosis; hepatic glucose production; glucose-metabolism-related disorder; disease; cancer; breast cancer; colon cancer; lung cancer; nuclodical disease; Huntington disease; spinocerebellar ataxia; viral disease; ALDS; hepatitis C virus; HCV; ss.

                      dyslipidaemias, hypercholestorolaemia, statin-resistant hypercholesterolaemia, coronary artery disease (CAD), coronary heart disease (CAD), coronary heart disease (CAD), coronary heart contains the caption of the reating successents and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the disease as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence represents a hepatitis C virus (HCV) antisense oligonucleotide that can be used to control HCV gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Сарв
                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                      The invention describes a kNA interference (lakkA) agent (1) comprising a gense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-0 alkyl modifications, the antisense cone or more asymmetrical phosphorothicate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (I); exabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its cortivity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (K1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (C) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M2) evels of cholesterol, and/or disregulation of lipid metabolism. The dispate is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholesterolaemia, statin-resistant cornary heart construction and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for represents a hepatitis C virus (HeV) antisense oligonucleotide that can be an exercised or corporary arrect (e.g., Huntington disease or processents and exercised or corporation or for treating glucose or corporation and an exercised or corporation or for treating glucose or corporation or for treating glucose or corporation or for treatin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cytostatic; anticonvulsant; noctropic; muscula; anti-HV;

The invention describes a kNA interierence (IKNA) agent (1) compitibility a gense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2. O alkyl modifications, the antisense sequence asymmetrical phosphorothioact modifications are approached asymmetrical phosphorothioact modifications are applicable antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (1); reducing (M1) apoB-100 are: a pharmaceutical preparation comprising (1); reducing (M1) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (1); contained a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (1) and instruction for its use; and a device that can be dispense or administer a composition comprising (1). (1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.

CC therwise unwanted expression of apucose-6-phosphatase levels.

The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apol-100, elevated or otherwise unwanted contevers and a disorder characterised by elevated or otherwise unwanted expression of apol-100, elevated or otherwise unwanted disorder is chosen from the HDL/LDL cholesterol imbalance, disparate (CC dyslipidaemias, hypercholesterolaemia, statin-resistent CC dyslipidaemias, hypercholesterolaemia, coronary artery disease (CAD), coronary heart conhibit hepatic glucose production or for treating glucose-metabolism. The disease samentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned electroned disease or epinesemblar ataxia) or viral disease (e.g., Hunisance), his sequence epinasciple decreases as mentioned electroned disease or epinesers 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                      The invention describes a RNA interference (iRNA) agent (I) comprising a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

cancernorm describes a range agencie, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequence and an antisense sequence where the sense sequences have one or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100 evels or glucose-6-phosphatase levels in a subject; producing (I); stabilising (I); involves selecting a sequence with activity and carbilising one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is custing for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or cherwise unwanted expression of apos-100, elevated or cherwise unwanted expression elevated or cherwise unwanted expression elevated or elevated or elevated or che
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antilipemic; cardiant; vasotropic; antiarteriosclerotic; antidiabetic; cytostatic; anticonvulsant; nootropic; muscula; anti-HIV; MAX interference; iRNA; antisense technology; liptid metabolism; cholesterol imbalance; dyslipidaemia hypercholesterolaemia; coronary artery disease; CAD; coronary heart disease; CHD; atherosclerosis; hepatic glucose production; glucose-metabolism-related disorder; diabetes; cancer; breast cancer; colon cancer; lung cancer; neurological disease; Huntington disease; spinocerebellar ataxia; viral disease; ALDS; hepatitis C virus; HCV; ss.
inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-Z diabetes. (1) is useful for treating the diseases as mentioned above, cancer (e.g. breat, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerbellar ataxia) or viral disease (e.g., AIDS). This sequence represents a hepatitis C virus (HCV) antisense oligonucleotide that can be used to control HCV gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   BXXXEX
                                                            The invention describes a kNA interference (ixAA) agong (i) compitating a gense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical phosphorothicate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (MI) apob-100 are: a pharmaceutical preparation comprising (I); reducing (MI) apob-100 stabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where introducing one or more asymmetrical modification in the sequence, where critically a kit comprising (I) and instruction for its use; and a device the modification descrass or administer a composition comprising (I). (I) is activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apob-100 levels or glucose-6-phosphatase levels. (MI) is useful for reducing apob-100 levels or glucose-6-phosphatase levels. (MI) is useful for reducing apob-100 levels or glucose-6-phosphatase levels. (MI) is useful for reducing apos-100 levels or glucose-6-phosphatase levels. (MI) is useful for reducing apos-100 levels or glucose-6-phosphatase levels. (MI) is useful for some from the HDL/LDL cholesterol imbalance, discase (CHD) and atherosclerosis (I) is administered to a subject to inhibit hepatic glucose-production or for treating glucose-metabolism-crolated diseases as mentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned e.g., Huntington disease or captured to a subject to spinocerbellar ataxia) or viral disease (e.g., Huntington disease or represents a hepatitis 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cytostatic; anticonvulsant; notropic; muscula, anti-HIV;

The invention describes a RNA interference (IRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-0 alkyl modifications, the antisense concerns and the antisense sequence targets a human gene sequence. Also described and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (II); and preparation comprising (II); reducing (II); involves selecting a sequence with activity and stabilising (II), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where controducing one or more asymmetrical modification in the sequence, where introducing one or more asymmetrical modification in the sequence, where contrivity a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition for its use; and a device that can be dispense or administer a composition comprising (I). II is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.

Cuseful for reducing apoB-100 levels or glucose-6-phosphatase levels.

Cuterwise unwanted expression of apoB-100, elevated or otherwise unwanted elevated is chosen from the HDJ/LDL cholesterol imbalance,

Cuseful diseases as mentorioned above, cancer (CC inhibit hepatic glucose production or for treating glucose-metabolism-related diseases as mentored as mentored (CC inhibit phapatic glucose production or for treating glucose-metabolism-related diseases as mentored (CC) inhibit phapatic glucose production or for treating glucose-form or for treating glucose-f
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                              for recovery of cells or clumps of cells, especially pancreatic islets or tumour cells. The tumour cells can be modified ex vivo and then returned to the patient (adoptive immunotherapy). After tissue degradation, the cells or clumps of cells are separated by centrifugation and on density gradients. The protease is produced by recombinant techniques. Primers used for manipulation of the protease coding sequence were synthesised based on peptide fragments of the protease. The primers are described in AAT32287-96. This primer used to amplify a 320 base pair partial sequence of the protease coding sequence which was then used for sequence
                                                                                                                                                                                                                                                                                    The neutral protease of Clostridium hystolyticum is used to digest tissue
                     Clostridium histolyticum; neutral protease; digestion; tissue; degradation; pancreatic islets; tumour; adoptive immunotherapy; cell.

This single nucleotide polymorphism (SNP) is a C at position 463 of the TPWT gene, and results in a Kily9r amino acid substitution (see ABR63163) in the TPWT protein. It is one of six newly identified SNPs in the TPWT gene that lead to low TPWT activity. A polymucleotide comprising the present sequence (sense or complementary strand) is claimed. Polymorphic TPWT polymertical substitutions for diagnosing or treating a TPWT-associated disease, or a succeptibility to such a disease, thiopurine-induced toxicity, myelosuppression (Pancytopaenia) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             gastrointestinal disturbances, leukopaenia, thrombocytopaenia, or anaemia
                                                                                                                                                                                                                                                                                                                                                                                           New thiopurine S-methyltransferase (TPMT) polynucleotide, useful for preparing diagnostic and pharmaceutical compositions for diagnosing and treating a TPMT-associated disease, e.g. leukopenia, thrombocytopenia or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human transcription termination factor binding protein 54 PCR primer 2.

The present invention describes a method for the recombination of nucleic acid (NA) templates. The method comprises: (a) providing at least two double-stranded templates (T1, T2) having different 5' and 3' regions in their sense strands; (b) around the templates with at least one each of forward and reverse primers that anneal, respectively, only to the 3'-region of the antisense strand of T1 and to the 3'-region of the sense strand of T2; (c) extending the primers by no more than 100 nucleotides trand of T2; (c) extending the primers by no more than 100 nucleotides (i); (d) separating extended primers, to either templates; (e) reannealing the extended primers, to either templates; (e) reannealing the extended primers, to either templates; (e) cycles of steps (b)-(e) until at least one full-length extended: (l) a method starting from at least one each of antisense and sense singlestranded templates; (2) generating a recombined polypeptide (I) with altered properties by expressing recombination products of the new
                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Rhodosporidium mutant TAL enzyme 3' region oligonucleotide SEQ ID NO:201.
       Human transcription termination factor binding protein 54 as one new kind of polypeptide and polynucleotides encoding this polypeptide.
                                                                                              The invention relates to human transcription termination factor binding protein 54 useful in treating various diseases, such as malignant tumour, nosobaemia, HIV infection, immunological diseases and inflammations. The present sequence is that of a human transcription termination factor binding protein 54 PCR primer of the invention
                                                                                                                                                                                                                                                                                            Gaps

The present invention describes a mouse (I), homozygous for a disruption in the alpha-L-iduronidase (IDUA) gene but with normal expression of the in the alpha-L-iduronidase (IDUA) gene but with normal expression of the heaptic sulphate transporter SAT-1 gene. (I) is used to evaluate the adents for use in treating mucopolysaccharidosis Type I (MPS 1) by administering the agent to (I) and evaluating the mouse for pathology associated with iduronidase deficiency. (I) may also be used to pathology associated with iduronidase deficiency. (I) may also be used to a specific tissue or organ in the mouse using the same techniques. Targeting systems which may be tested using this regime include a target-complection aspecific label, a viral expression vector or a liposome coupled to pathology of MPS I. The SAT-1 gene overtalps with the IDUA gene but in (I) pathological effects observed in (I) are due solely to the disruption of the IDUA gene. The present sequence represents a IDUA genomic DNA
                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New transgenic mouse, useful for modeling lysosomal disorders and testing cell- or tissue-specific targeting systems.
processes and screening the polypeptides formed for properties different from those of polypeptides from either of the templates; and (3) (1) produced by method (2). The methods are useful for the recombination of nucleic acid templates of interest, and generation of a recombined polypeptide having altered properties. The method can be used to make combined genes that express proteins e.g. enzymes, cytokines, growth factors, viral proteins or microbial antigens with altered properties, e.g. stability, activity or specificity. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Murine; mouse; alpha-L-iduronidase; IDUA; hepatic sulphate transporter; SAT-1; mucopolysaccharidosis type I; MPS I; transgenic mouse; cell.specific targeting system; tissue-specific targeting system; lysosomal disorder; ss.
                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel human zinc finger protein 27.50, and the polymucleotide encoding it. The polypeptide is useful for treating several diseases, such as solid tumour, nervous system disease, malignant disease of blood, development disturbance and HIV infection. The sequence represents a PCR primer used in example 3 of the invention

```
The invention relates to an isolated polypeptide (I) of Kringle protein 14 and the polypuclectoride (II) encoding (I). (I) and (II) are used in diagnosis and treatment of malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The present sequence represents a reverse transcriptase (RT)-PCR primer used to isolate the coding sequence of kringle protein 14 as described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Kringle protein 14 and encoding polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and inflammation.
antiinflammatory; malignant tumour; haemopathy; inflammation; primer;

The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and determining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (WM) for predisposition to a disease, associated with a gene that includes one or more PML, and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a disease-related gene, that are associated with a predisposition to
                                                                                          The invention relates to human protease regulatory protein 28.27, the polynucleotide encoding it, the process for preparing the polypeptide by DNA recombinant technology, the application of the polypeptide in treating diseases (e.g. cancer, HIV infection), an antagonist of the polypeptide and its medical function and the application of the polynucleotide. The present sequence is that of a human protease regulatory protein 28.27 PCR primer useful in examples of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.
   Polypeptide-human proteinase regulatory protein 28.27 and polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Prion protein polymorphic microsatellite marker consensus sequence #30.
                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to rat receptor tyrosine kinase (KDR) and its corresponding nucleic acid sequence. The nucleic acid molecules of the invention are useful for identifying compounds that modulate wild-type rat KDR activity to evaluate the safety and efficacy of specific inhibitors of KDR in rats. KDR inhibitors are useful for treating cancer, ischaemic ocular diseases such as proliferative retinopathy and inflammation. The present sequence is a reverse transcription (RT) PCR primer used for cloning rat KDR cytosolic domain. This sequence is used in the exemplification of the invention.
diseases and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, hormones or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a prion protein polymorphic microsatellite marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecules encoding rat KDR protein, useful for identifying inhibitors of KDR activity for treating cancer, ischemic ocular diseases, and inflammation.

PCR primers AAAG3751-52 were used to amplify a murine cDNA sequence encoding a neutral endopeptidase metallopeptidase (NEP)-like polypeptide, designated NL-1. The specification also describes NL-2 and NL-3. The NL enzymes are used to test for specific inhibitors. The N-terminal region of the enzymes can be used to promote production and secretion of foreign protein and active biopeptides, using chimeric constructs containing the foreign protein adventered from and in phase with the N-terminal region. The NL enzymes are have been localised to the brain, and may be useful in the treatment of neurological diseases such as Alzheimer's disease, pain, and psychiatric disorders. NL enzymes have also been localised to the testis and ovaries, and may be used to control fertility. They have also been localised to bones, and may be used to creat bone diseases, and any be used to treat bone diseases, and any be used to treat bone diseases, and any be used to improper peptide processing by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a signal amplification method (MI) for detecting expressed gene using reverse transcription reaction and a self-assembly reaction of forming a self assembly of oligonucleotide probes, thus improving detection sensitivity of the expressed gene in a DNA chip. (MI) is useful for signal amplification method (MI) for detecting expressed gene (claimed). (MI) improves detection sensitivity of the expressed gene in a DNA chip (claimed). (MI) does not require use of expensive enzymes and enables detection corresponding to the original RNA length oxpression amount because of using nither linear amplification nor PCR. This sequence corresponds to a nucleotide used in the method of the
                                                                                                                                                                                                                                                                                                                           signal amplification method; gene expression; reverse transcription;

The present invention relates to a method for sorting genes. The method comprises producing first double stranded (ds) CDNA from mRNA by reverse comprises producing first double stranded (ds) CDNA is then digested with a restriction enzyme that generates cohesive ends with overhanging single correction enzyme that generates cohesive ends with overhanging single stranded sequence containing a constant number of nucleotides, and the digestion products are ligated to a set of ds DNA oligonucleotide and adaptor has at one end, a sequence complementary to a cossible overhang and the other end a primer-template sequence specific for the adaptor complementary sequence, and between these two ends the amplified in separate PCR says, using for each a primer that anneals to polyr and a second primer, from a set that anneals to the CDNA specific polyr and a second primer, from a set that anneals of the CDNA specific copy and a second primer, from a set that anneals of the CDNA specific primer-template sequences. Amplicons are finally sorted into noncredundant conders are primer template sequence and thus primed PCR. The method is useful for producing a collection of non-redundant colly sepacially where the overy expressed-gene transcript in the original sample is represented by the subgroups of genes, analysis and diagnosis of diseases, for studying coll differentiation and in gene therapy. The present sequence was used to illustrate the method of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

(BIOS-) BIOS RES INST INC.

```
The invention relates to an isolated CD49f-positive adult human salivary CC gland stem cell (hSGSC) which is capable of differentiating into cells characteristic of various organs such as the liver or pancreas when cultured in vitro. Specifically, the hSGSCs are capable of cultured in vitro. Specifically, the hSGSCs are capable of specifically constituted and albumin-positive cells, insulinguistive cells produced from MSGSCs; methods of inducing differentiation of hSGSCs into nestin-positive/albumin positive, insulinguistive or glucagon-positive cells by in vitro culture in the presence of a fibroblast growth factor, epithelial cell growth factor and cells produced from method of isolating hSGSCs from human callvary gland and culturing them in the presence of epithelial cell computed and culturing them in the presence of epithelial cell computed the regenerated organs eliminate transplant rejection, as the stem cells used to produce the organs are taken from the patient.

CC primers and and produce the organs are taken from the patient.

CC sequences ADR32209-ADR32230 represent reverse transcription-PCR (RT-PCR) primers used to analyse gene expression in hSGSCs in an example of the
                                                                                                            New isolated human stem cell from a salivary gland, capable of differentiating into a nestin-positive and albumin-positive cell, insulin positive and glucagon-positive cell, for use in the regeneration of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Rat; cerebellum derived growth factor; CDGF1; screening; binding; modulation; erbB type receptor; identification; indication; risk; proliferation; differentiation; induction; neuron; hyperplasia; stem cell culture; intracerebral graft; alleviation; repair; behavioural defect; nervous system; central; peripheral; nerve; prothesis; damage; entubulation; cell survival; treatment; injury; trauma; ischaemia; ischemia; stroke; infection; disorder; inflammation; envocepenration; disease; Parkinson's; Huntingdon's; amylotrophic lateral sclerosis; sensory; retina; spinocerebellar degeneration; multiple sclerosis; neoplasia; amalignant glioma; meuroectodermal tumour; primer;

                                                                                                                                                                                                                                      The present sequence is a primer for the PCR amplification of rat cerebellum derived growth factor 1 (CDGF1) cDNA. CDGF can be used to screen for modulators of CDGF binding to erbs type receptors.

Identification of a modification or mutation in a CDGF gene, or aberrant indicate the risk of unwanted cell proliferation or differentiation. CDGF may be used to induce neuronal differentiation in stem cell culture, and maintain the integrity of a terminally differentiated neuronal cell culture, e.g. useful for intracerebral grafting to alleviate behavioural defects. CDGF may also be used in nerve protheses to repair central and peripheral nerve damage, especially where a crushed or severed axon is chtubred, by a prostheric. CDGF may also be used to enhance neuronal cell survival in the central or peripheral nervous system, to treat cell survival in the central or peripheral nervous system, to treat cell survival in the central or peripheral nervous system injury, e.g. traumatic, chemical or vasal injury and deficits such as ischaemia resulting from stroke, infectious/inflammatory and tumour induced injury, chronic neurodegenerative disease including Parkinson's and Huntingdon's, amylotrophic lateral sclerosis, spinocerebellar degeneration, chronic immunological disease of the nervous system including multiple sclerosis, disearches of the sensory neurons and degenerative diseases of the retina. CDGF may also be used to treat neoplastic or hyperplastic expenses.

                                                                                                                                                                                                                     The present invention relates to a hairpin or hammerhead ribozyme, designed to cleare RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.

Representative examples of ribozyme recognition sites are given in AAA88415 to AAA68797. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                    New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

Thosyme (1) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antisebortheic, antisiabetic, antisickling, ophthalmological, vulnerary, krateolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, aickle cell retinopathy of prematurity and retinal detachment, and for treating and preventing prematurity and retinal detachment, and for treating and preventing carring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57877 to AAH62099 represent sequences used in the cremplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to von Willebrand factor. The present sequence represents a primer used in the methods of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Method for purifying factor VIII using chimera antibody to von Willebrand
                                    The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel antisense compound targeted to a nucleic acid molecule encoding human apolipoprotein B (ApoB) which specifically hybridises with and inhibits the expression of human apolipoprotein B. The compound of the invention demonstrates antiarteriosclerotic, cardiant, antidiabetic and anorectic activities and may be useful for preparing a composition for treating abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or cardiovascular disease. Furthermore, the compound has gene therapy applications. The current sequence is that of the 2.0-omethoxytehyl (2.90) Phosphorothicates antisense oligo of the invention which has 2.00 Wings', a phosphorothicates backbone throughout and in which all cytidine residues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense compound, useful for preparing a composition for treating abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidemia or cardiovascular disease.

```

```
The present sequence is that of a single mismatch target sequence for a molecular beacon comprising an oligonucleotide probe (see ABL57069) covalently attended at the 3' end to fluorescent dye and at the 5' end to a nanoparticle. In the native state, the probe forms a hairpin conformation with hybridised termini. The probe forms a hairpin and quencher (gold nanoparticle) in the molecular beacon results in little or no detectable fluorescence. Upon hybridisation of the central complementary stretch of the probe to a target sequence, such as the present sequence, the hairpin undergoes a conformational change resulting in an increase in fluorescence, the extent of which is proportional to the amount of target sequence, the extent of which is proportional to the amount of target sequence present. Experiments with the present sequence and a perfectly-matched target (see ABL57071) showed that sequence and a perfectly-matched target (see ABL57071) showed that change the proportion and confirmates generally to the use of metal surface quenchers such as particles or films for high sensitivity applications in, for example, detection and

The DNA primer is used with primers AAQ92370-77 in the reverse transcription-polymerase chain amplification of alpha- lactalbumin from MA104 cells and topoisomerase-IIa from Jurkat cells. Amplification is carried out using DNA-polymerase Ifil from Thermus fillformis (AAR76060) (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New heat-stable DNA polymerase from Thermus filiformis - has reverse transcriptase activity in the presence of magnesium ions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; FD23; cytostatic; haemostatic; virucide; immunomodulatory; antiinflammatory; malignant tumour; haemopathy; HIV infection; immunological disease; inflammatory condition; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the use of acylated aminopropane diols and their analogue (I), their optical and geometric isomers, racemates, salts, and mixtures in pharmaceutical compositions for the treatment of pathological states in which there is lipid or carbohydrate metabolism disturbance, inflammation, and/or cell differentiation or proliferation disturbance. The compounds are useful for the treatment of lipid and carbohydrate metabolism disorders such as syndrome X, diabetes, atherosclerosis and obesity, inflammatory disorders such as atherosclerosis, allergies, asthma, eczema, psoriasis, and itching, and cell proliferation and differentiation disorders such as carcinogenesis. In an example of the invention, the effectiveness of the compounds to activate peroxisome proliferator-activated receptor (PPAR) genes was tested by gene analysis using PCR. This sequence represents a primer used in the PCR analysis.

including autoimmune diseases, degenerative nervous system diseases, graft versus host diseases, hypersensitivity diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addison's diseases, atrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to allergies. Type II hypersensitivities used as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by wordpacterium. Neoplastic diseases include lymphoproliferative diseases
                                              Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a Vbeta gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        breast. The present sequence represents a Vbeta gene repeat sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel nucleic acid obtained from 4 synthesis-period of neuroblastoma cells useful for prognosing and determining progress stage of
                                                                                                                                                                                                                                           The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               4 synthesis-period of neuroblastoma related primer, SEQ ID 324.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; 4 synthesis-period; neuroblastoma; stage 4S; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                       This invention relates to the human FD23 protein and the CDNA sequence encoding it. Included in the invention is a vector containing a FD23 encoding polynucleotide, a host cell containing the vector, and an antibody directed against FD23. Both the FD23 protein, and CDNA encoding it can cause cytostatic, haemostatic, virucide, immunomodulatory or antificity, when used in the diagnosis and treatment of malignant tumours, haemospathy, HIV infection, immunological disease and various inflammatory conditions. The present sequence represents a PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               human; T-cell associated disease; Vbeta; autoimmune disease; degenerative nervous system disease; graft versus host disease; hypersensitivity disease; infectious disease; neoplastic disease; Addison's disease; atrophic gastritis; degenerative nervous system disease; multiple sclerosis; Alzheimer's disease; hypersensitivity; disease; type I hypersensitivity; doodpasture's syndrome; type II hypersensitivity; doodpasture's syndrome; type IV hypersensitivity; leprosy; infectious disease; viral infection; HIV; fungal infection; Mycobacterium; neoplastic disease; limitedian; Mycobacterium; neoplastic disease; lymphoproliferative disease; leukaemia; lymphoma; cancer; brain cancer;
                                                                                                                                                                                             Human FD 23 and encoded polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and inflammation.

Analyzing a target nucleic acid sequence in a biological material by real time PCR using nucleic acid primers that are separated by at least 750 nucleic acid residues in the target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method for analysing a target nucleic acid sequence in a biological material. The method comprises adding at least two nucleic acid primers that hybridise under stringent conditions to predetermined nucleic acid sequences of the target nucleic acid sequence that are separated by at least 750 nucleic acid residues, amplifying the target nucleic acid sequence by PCR, and detecting and quantifying the target nucleic acid sequence. The methods and compositions of the present invention are useful for analysing a target nucleic acid sequence in a biological material by real time PCR using nucleic acid primers that are separated by at least 750 nucleic acid residues in the target sequence. This polynucleocide sequence represents
                                                  The present invention relates to human nucleic acid sequences (1; ADO15739-ADO15912) obtained from 4 synthesis-period (stage 4S) of neuroblastoma cell. (I) is useful for prognosing and determining the progress stage of 4 synthesis-period of neuroblastoma. The present sequence is a primer, used to illustrate the invention.
                                                                                                                                                                                                                                     Gaps

The invention relates to a method of determining (MI) level of potentially active blological pathogens in biological material, involves optentially active blological pathogens in biological material, involves camplifying target nucleic acid primare pairs to biological material, amplifying target nucleic acid sequences by PCR, and detecting and amplifying target nucleic acid sequences by PCR, and detecting and amplifying target nucleic acid sequences by PCR, and detecting and and sequences is proportional to number of biological pathogens in a biological material such as cells, biological material ablod or blood components, proteins, enzymes, immunoglobulins, tissues, blood or blood components, proteins, enzymes, immunoglobulins, tissues, blood or blood components, proteins, enzymes, immunoglobulins, botanicals, contains cells, cells, cartilage, corneas, arteries, veins, organs, contains cells, cells, cartilage, corneas, arteries, veins, organs, compose, collagen, chitin and its derivatives, forensic samples, munmified material, human or animal remains, stem cells, islet of inangerhans cells, cells for transplantation, red blood cells, white collocatels or platelets. The bological pathogen is chosen from Aspergillus, Candida, Histoplasma, and single cell parasites. The blological pathogen is chosen from Aspergillus, Candida, Histoplasma, Salmonella, Carteromoreer, Corresponenter, ilsteria, clostridium, Streptococcus, Staphylococcus, Serratia, Enrechaecter, Salmonella, Proteological pathogen is chosen from Adeno-associated virus (HAV), Hepatitis Virus, Hepatitis Envirus, Paramity, Hepatitis Envirus, Material Envirus, Hepatitis Envirus, Material 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Determining level of potentially active biological pathogens in biological material, by adding nucleic acid primer pairs to biological material, amplifying target nucleic acid by PCR, detecting and quantifying target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Marlowe K, Armistead
                                                                                                                                                                                                                                                                       Hepatitis B virus DNA detection primer #12.

New gene encoding Mch3, a cysteine protease that regulates apoptosis - for treating human diseases associated with apoptosis, and screening for antagonists and agonists of Mch3.

Example 1; Page 26; 52pp; English.

Vector-specific primer SK-Zap (T66995) was used with primer T50-prl (T66994), based on a GenBank sequence expressed sequence tag, to amplify cDNA from a human Jarkat library. A Ced3-interleukin-1- beta converting enzyme (ICB)-11ke partial cDNA clone was identified. This was used to rescreen the library, leading to the isolation of cDNA clones (T66992-93) for novel apoptotic cysteine protease Mch3-alpha (W15262) and Mch3-beta (W15263)

This sequence represents a primer for the Mch4 and Mch5 genes of the invention. Mch4 (see AAW23790) and Mch5 (see AAW27391) are members of the Aspartic acid specific Cys protease family involved in cell apoptosis. The genes and proteins can be to diagnose, treat or reduce the severity of diseases resulting from increased cell survival, e.g. hormone dependent tumours such as breast, prostate or ovarian cancers, or autoimmune diseases, such as systemic lupus erythematosus or immunoglobulin mediated glomerulonephritis, diseases resulting from decreased cell survival, e.g. degenerative diseases such as Alzheimer's or Parkinson's disease, or amyotrophic lateral sclerosis or other diseases associated with increased apoptosis such as aplastic anaemia, stroke, ischaemic injury following myocardial infarction or reperfusion injury. The present PCR primer was used to amplify Mch6 cDNA. Mch6 is a ced-3 chomologue, and is a member of the ICE (interleukin-1-beta converting coryme) family of aspartate-specific cysteine proteases (ASCPS). The enzyme) family of aspartate-specific cysteine proteases (ASCPS). The cypedification describes a method for identifying mammalian Mch6 activity modulators (inhibitors or enhancers). The compounds identified by the compounds and hard so lateral solar solar seases characterized by increased apoptotic cell death such as Alzheimer's pigmentosa, or cerebellar degeneration, myelodysplastic syndromes such as plastic anemia, ischemic injury including myocardial infaction, stroke compounds are also useful for treating comportate and ovarian cancer. Increased cell survival or apoptosis cypostete and ovarian cancer. Increased cell survival or apoptosis cypostete and ovarian cancer. Increased cell survival or apoptosis inhibition also results in autoimmune diseases such as systemic lupus confering and immune-mediated glomerulonephritis as well as viral identified compounds are useful for treating these conditions. The Mch6 inhibitors are used to treat or to reduce severity of diseases

```

```
The invention relates to an isolated gene encoding MCH6 (mammalian ced-3 chomologue 6) an aspartate-specific cysteine protease and the MCH6 compose to a specific cysteine protease and the MCH6 colypeptide. The MCH6-encoding nucleic acids and polypeptides can be used to dispanse, treat (e.g. by gene therapy) or reduce the severity of cell compose, treat (e.g. by gene therapy) or reduce the severity of cell composes e.g. Alzheimer's disease, Parkinson's disease, amyotrophic diseases e.g. Alzheimer's disease, Parkinson's disease, amyotrophic compelopyplatic syndromes, e.g. aplastic and ememia, ischaemic injury, composardial infarction, stroke and troperfusion injury. The MCH6-encoding concleic acids and polypeptides can also be used to disagnose or generate concleic acids and polypeptides can also be used to disagnose or generate conclidents. A purified recombinant WCH6 protein can be used to measure coll death. A purified recombinant WCH6 protein can be used to measure coll death. A purified recombinant WCH6 protein can be used to measure consistency in the control of a continuous fluorometric assay. The present sequence is a PCR primer control of the control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated gene encoding apoptic protease, mammalian ced-3 homologue 6 (Mch6). Mch6 is a member of the aspartate-specific cysteine protease (ASCP) family. Mch6 DNA and protein sequences are useful for modulating apoptosis for the therapeutic treatment of human diseases. Mch6 sequences are useful for upregulating apoptosis (e.g. for treating apoptosis (e.g. for treating apoptosis or treating along a crebellar degeneration). The Mch6 sequence is useful for disease or crebellar degeneration). The Mch6 sequence is useful for diseases, as well as other diseases mediated by either increased or decreased programmed cell death. The present sequence is a primer, used for cloning and characterisation of Mch6
                                                                                                                                                                                                                                                               Apoptic protease; mammalian ced-3 homologue 6; Mch6; cancer; aspartate-specific cysteine protease; ASCP; apoptosis; therapy; autoimmune disease; cerebellar degeneration; Alzheimer's disease; cytostatic; Parkinson's disease; immunomodulator; antimicrobial; viral infection; cell death-mediated disease; neuroprotective; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New apoptotic genes and their apoptotic protease products, useful for modulating apoptosis for the therapeutic treatment of human diseases, e.g. cancers, autoimmune disease, Alzheimer's disease or Parkinson's

The present PCR primer was used to amplify DNA encoding an apoptotic protease, designated Mch6. Mch6 is an aspartate-specific cysteine protease, Mch6 polypetides and polynucleotides can be used to diagnose, treat or reduce the severity of cell death-mediated conditions, e.g. cancers, autoimmune diseases such as systemic lupus erythematosus, viral infections such as herpesvirus, degenerative disorders auto as Alzheimer's disease and Parkinson's disease, myelodysplastic syndromes such as myocardial infarction and stroke. They can also be used to screen
                                                                                                                                                                                                                                                                                                                                                                                                Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gene therapy; aspartate-specific cysteine protease agonist; aspartate-specific cysteine protease antagonist; whis; mammalian ced-3 homologue 6; apoptosis; cancer; viral infection; degenerative disorder; Albeiners disease; Parkinsons disease; myocardial infarction; human; mammalian ced-3 homologue 6; Mch6; PCR;

                                                                                                                                                                                                                                                                                                                                     The invention describes an isolated gene (I) encoding Mch6 (mammalian ced -3 homologue 6), or a functional fragment of it. (I) And the polypeptide encoded by (I) is used to modulate apoptosis for the therapeutic treatment of human diseases. (I) Is used to prepared a recombinant aspartate-specific cysteine protease, that it encodes. The recombinant protease can be used to screen for Mch6 inhibitors. Disorders involving apoptosis that can be disagnosed or treated by (I) or the polypeptide incodes, including cancers, viral infections, degenerative disorders, such as Alzheimers and Parkinsons disease, and myocardial infarction. This sequence represents a primer used in the isolation of human mammalian ced-3 homologue 6 (Mch6), a member of the aspartate-specific cysteine protease (ASCP) family of proteases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antilipemic; cardiant; vasotropic; antiarteriosclerotic; antidiabetic; cytostatic; anticonvulsant; nootropic; muscula; anti-HIV; RNA interference; iRNA; antisense technology; lipid metabolism; cholesterol imbalance; dyslipidaemia hypercholesterolaemia; coronary artery disease; CAD; coronary heart disease; CHD; atherosclerosis; hepatic glucose production; glucose-metabolism-related disorder; diabetes; cancer; breast cancer; solon cancer; lung cancer; aneurological disease; Huntington disease; spinocerebellar ataxia; viral disease; AIDS; hepatitis C virus; HCV; ss.

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-0 alkyl modifications, the antisense concernse asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described and the antisense sequence targets a human gene sequence. Also described and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (I); reducing (I); involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where contrivity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is conseful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or cherwise unwanted expression of apoB-100, elevated or otherwise unwanted controllesterolasmical adjoorder characterised by elevated or disorder is chosen from the HDD/LDL cholesterol imbalance, disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepetic glucose production or for treating glucose-metabolism. Controllesterolasmia, coronary attery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepetic glucose production or for treating glucose-metabolism.

Controllesterolasmia, coronary attery disease (CAD), coronary heart controllesterolasmia, coronary attery disease. (I) is useful for related disorder e.g. diabetes or type-2 diabetes. (I) is useful for related disorder e.g. diabetes or type-2 diabetes. (I) is useful for related disorder e.g. diabetes or type-2 diabetes. (I) is useful for represents a hepatitis C virus (HCV) antisense oligonucleotide that can represent a hepatitis C virus (HCV) antisen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Interference RNA agent useful for treating dyslipidemias, coronary disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                                   This invention describes a novel antisense compound (I) 8-30 nucleobases in length targeted to a polynucleotide encoding human telomeric repeat binding factor 2 (II) which specifically hybridizes with, and inhibite the expression of (II). (I) is useful for treating a human having a disease or condition associated with (II) such as premature aging or a hyperproliferative disorder especially cancer, by inhibiting the expression of (II) in human cells or tissues. (I) is useful for disagnostics, therapeutics, prophylaxis and as research reagents and kits. The products of the invention have cytostatic activity. This sequence represents an antisense oligonucleotide used to illustrate the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        p53 protein; cell cycle control; apoptosis; oesophageal tumour; pancreatic tumour; colorectal tumour; renal cell carcinoma; cervical carcinoma; cancer; p21 promoter; ss.

The invention relates to a method (MI) of identifying compounds that modulate the binding of p53 protein to a gene of interest, involving the gene of interest as chromatin-assembled DNA, contacting the gene of interest with the p53 protein and a test compound, and determining whether the presence of the test compound modulates the compound modulates the compound modulates the binding of the p53 to the gene of interest. Also described are the collowing: (1) Identifying a modulator that inhibits growth of cancer cells, which involves providing a gene construct comprising a chromatin assembled DA1 promoter linked to a reporter gene, where the promoter interests binding of the p53 protein to the gene construct by measuring the amount of reporter gene activity in the presence and absence of the cinteraction of p53 protein to the gene construct by measuring the amount of reporter gene activity in the presence and absence of the cinteraction of p53 protein with a transcription of contror hink as construct by measuring the amount of reporter gene activity in the presence and absence of the amount of reporter gene activity in the presence and absence of the contror in the p53 protein to bound to a gene of interest, which involves providing the gene of interest with the p53 protein the presence of the test compound, and determining whether the presence of contacting the gene of interest with the p53 protein comprises a human p53 protein, recombinant p53 protein or p53 protein comprises a human p53 protein, recombinant p53 protein or p53 protein comprises a contacting the gene of interest with a cell nuclear extract. The gene of interest with a cell nuclear extract. The gene of interest with a cell nuclear extract. The gene of the test compound modulates the p53 controlled contacting the gene of interest with a cell nuclear extract. The gene of the test compound modulates the p53 controlled contacting the gene of interest with a cell modulates the p53 controlled contacting the gene of interest with a cell modulate the pre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying compounds that modulate binding of p53 protein to gene, by providing gene as chromatin-assembled DNA and contacting with protein and test compound, and determining whether compound modulates binding of p53.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      invention relates to a method (M1) of identifying compounds that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 22 BP; 5 A; 5 C; 7 G; 5 T; 0 U; 0 Other;

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense eligonucleotide that specifically hybridises with a nucleic acid molecule encoding P13K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorotchioare linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New Jagged peptides for inhibiting differentiation of progenitor cells also used for maintaining these cells in undifferentiated state, e.g. for haematopoietic reconstitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This nucleotide sequence comprises the intron 10-exon 11 boundary of the human JAGGED1 gene. 47 Intron/exon boundaries have been defined (see AAX06701-47) by comparison of genomic sequences from bacterial artificial chromosome 49D9 and an isolated cDNA clone (see AAX05753). Exon 11 corresponds to nucleotides 1762-1808 of the hAAGGED1 cDNA. hJAGGED1 (see also AAW87894) is a Notch ligand capable of inhibiting the differentiation of haemacopoletic progenitor cells. Mutation of the hJAGGED1 gene is associated with Alagille syndrome. The Jagged1 gene has
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Agrobacterium tumefaciens NT1130; 1,5-anhydroglucitol dehydrogenase; 1,5-AGDH; detection; diabetes; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                              exon 11 (exon length is 47 bp)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0.3%; Score 16.8; DB 1; Length 20; 90.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-1-kinase, regulatory subunit 4, p150. The plantage oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified augar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified on ucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease
                                    antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, Chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                condition associated with phosphoinositide-3-kinase, regulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

The invention by towards a novel spacem to perturning traditions, that comprises a first solid support with a reactant of each reaction impobilized on to it, and a second solid support either providing a second reactant confined to a specific area on the surface, or a chemical factorial separation of the reactions, where the first and second solid supports are assembled to provide an environment for performing the reactions in parallel. The methods and apparatus are useful for certions in parallel. The methods and apparatus are useful for performing a large number of chemical and bhological reactions. Sequence variations, expression levels and their functions. The method is capable of generating large amounts of data or products per unit time by carrying out large numbers of reactions in parallel. The process is also menable to full automation. The present sequence represents a control probe used in detecting amplified products by allele specific extension, the products amplified by performing large numbers of PCR reactions using array-immobilised and releasable primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.

                                                                                                                                                                                                                                                                                                           A gene encoding 1,5-anhydroglucitol dehydrogenase, a recombinant vector containing the gene, a transformant containing the recombinant vector and a recombinant 1,5-anhydroglucitol dehydrogenase protein prepared from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes the 1,5-anhydroglucitol dehydrogenase protein (1,5-AGDH) isolated from Agrobacterium tumefaciens. The 1,5-AGDH protein is useful as a detecting reagent for early stage diabetes. The present sequence represents a PCR primer for 1,5-AGDH, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Negative control probe used in detection by allele specific extension.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navi.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navi.3. The compound and composition are useful for treating a disease or condition associated with Navi.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, pain from burns, migraine headache, cluster headache, mid-to-moderate pain from burns, migraine headache, cluster headache, mid-to-moderate but not limited to neonatal or infantile epilepsy, or ataxia. The present but not limited to neonatal or infantile epilepsy, or ataxia. The present a deoxy gap. Used during the antisense inhibition of human Navi.3 expression, the oligonucleotides are designed to target different regions of the human Navi.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compound targeted to a nucleic acid molecule encoding abavi.3, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, selzure disorder such as childhood seizure disorder, or ataxia.
              The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.
                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a new antisense compound, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding endothelial specific molecule-1 (ESM-1), that specifically hybridises with the nucleic acid ESM-1 and inhibite its expression. Also described are: a composition; inhibiting the expression of ESM-1 in calls or tisques; and treating an animal having a disease or condition associated with ESM-1. The compound is useful for preparing a composition for treating diabetes,
                                                                                                                                                                                                                                                                                                               cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; gene therapy; endothelial specific molecule-1; ESM-1; ESM-1 ESM-1 talated disorder; diabetes; cancer; ischaemia; reperfusion injury; angiogenic disorder; immunological disorder; cardiovascular disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense compound, having a sequence targeted to a nucleic acid encoding endothelial specific molecule-1 (ESM-1), useful for preparing composition for treating e.g., diabetes, cancer or cardiovascular disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note= "OTHER= phosphorothioate backbone. nucleic acid ESM-1 and inhibits its expression. Also described are: a composition; inhibiting the expression of ESM-1 in cells or tissues; and treating an animal having a disease or condition associated with ESM-1. The compound is useful for preparing a composition for treating diabetes, cancer, ischaemia or reperfusion injury, or angiogenic, immunological, cardiovascular or neurological disorder. This sequence represents an antisense oligonucleotide that can be used to modulate expression of endothelial specific molecule-1 (ESM-1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; gene therapy; endothelial specific molecule-1; ESM-1; ESM-1 related disorder; diabetes; cancer; ischaemia; reperfusion injury; angiogenic disorder; immunological disorder; cardiovascular disorder; neurological disorder; antisense technology; ss.

The present sequence is a sense primer for the PCR amplification of human matrix metalloproteinase 2 (MMP-2) cDNA. A 181 bp product is obtained using this sense primer with the antisense primer given in ACC57853. RT-PCR was performed in an example from the invention to determine expression profiles of MMP genes in human synovial cells in response to mechanical shear. A model-based analysis was used to identity the role of transcription factor binding motifs in gene regulation. The results provide an example of the method of the invention for determining expression levels of target genes based on sequence elements present in untranslated regulatory regions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Predicting an expression level of a target gene or gene family comprises experimentally determining the number and type of cis-acting elements provided in 5' untranslated regulatory regions of the target gene.
absence or severity of a particular phenotype or disorder (e.g. cardiovascular disease such as coronary heart disease associated with a particular genotype. The nucleic acids containing the polymorphic sites may also be useful in forenatcs and paternity testing. Wild-type or variant nucleic acid molecules encoding VLDLr or wild-type or variant buchets can be used in the disgnosis and treatment of cardiovascular diseases and other diseases associated with VLDLr. The present sequence represents the coding sequence of VLDLr single
                                                                                                                                                                                                                                                                                                                                                                        Сарв

                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                        The invention describes a new antisense compound, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding endothelial specific molecule-1 (ESM-1), that specifically hybridises with the nucleic acid ESM-1 and inhibits its expression. Also described are: a composition; inhibiting the expression of ESM-1 in cells or tissues; and treating an animal having a disease or condition associated with ESM-1. The compound is useful for preparing a composition for treating diabetes, cancer, ischaemia or reperfusion injury, or angiogenic, immunological, earlievascular or neurological disorder. This sequence represents an antisense oligonucleotide that can be used to modulate expression of endothelial specific molecule-1 (ESM-1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to polymorphic nucleic acid sequences encoding the very low density lipoprotein receptor (VLDLr) and methods of analysing a nucleic acid sample for polymorphisms. This method comprises obtaining a nucleic acid sample from one or more individuals, and determining the nucleic acid sample from or more of the polymorphic sites of one or more nucleic acid molecules. The method is useful for predicting the presence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Very Low Density Lipoprotein Receptor; VLDLr; cardiovascular disease; single nucleotide polymorphism; SNP; coronary heart disease; forensic; paternity testing; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                              ADM94102;
                                                                                         RESULT 382
```

```
The invention describes an animal model for identifying agents which alleviate the symptoms of, treat, reduce the severity of, or prevent preclampsia comprising a pregnant borderline hypertensive (BPH/5) mouse, preclampsia comprising a pregnant borderline hypertensive (BPH/5) mouse, and an agent suspected to alleviate the symptoms of, treat, reduce the ceverity of or prevent preclampsia which has been introduced to the mouse. Also described are: a method for screening for compounds useful for the treatment or amelioration or alleviation of preclampsia and/or the symptoms; a method of detecting placental abnormalities in an animal suffering from preclampsia, and an animal anotanisties in an animal suffering from preclampsia, and an animal abnormalities in an animal suffering from preclampsia, and an animal model is useful for understanding preclampsia, and would hold creat potential for design and implementation of effective prevention and great potential for design and implementation of effective prevention and treatment. The animal model is useful for identifying nucleic acid sequences, i.e., genes, and/or amino acid sequences that are associated with preclampsia and its development, especially those that up- or downtrequence, i.e., genes, and/or amino acid sequences that are associated outled administration to the patient having the disease, and can aid in actual administration to the patient having the disease, and can aid in the prognosis of a patient. The animal model is useful for therming the pathology. This sequence represents a mouse vascular endothelial growth factor (VEGF) PCR primer used in real time PCR to compare placental gene engage of the progness and secular endothelial gene engage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New animal model comprising a pregnant borderline hypertensive (BPH/5) mouse and an agent introduced to the mouse, useful for identifying agents which alleviate the symptoms of, treat, reduce the severity of, or

The present invention describes a new composition comprising an isolated projective for modified Bacillus thuringiensis crystal proteins (CrylC). The polypeptide for modified Bacillus thuringiensis crystal proteins (CrylC). The polypeptide of the composition is toxic to an insect cell and comprise within an insecticidal formulation can be used as a plant protective spray which is toxic to caterpillars, beetles and mosquitoes. The polypeptide of the composition may be used to kill an insect through ingestion of the composition may be used to kill an insect through with the composition or a transgenic plant that expresses the polypeptide composition. The insecticidal proteins produced by B. thuringiensis are harmless to plants and other non-targeted organisms but toxic to their specific target insect. The polypeptides have improved toxicity so a reduced amount of bioinsecticide per unit area of treated crop can be used allowing economic and efficient utilization in the field. The
                                                                                                                                                                                                                                                                                                                                                     New modified delta-endotoxin crystal proteins from Bacillus thuringiensis
     Bacillus thuringiensis; delta-endotoxin; insecticide; crystal protein;
                      lepidopteran insect, CrylC, genetic engineering, mutagenesis; mutant, caterpillar, beetle, mosquito, toxic, modification, PCR primer, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bacillus thuringiensis, CrylC; crystal protein; insecticide; insect; delta-endotoxin; lepidopteran; modification; genetic engineering; resistance; mutant; mutagenesis; PCR primer; ss.

                                                                                                                                                                                                                                                                                                 Mutant, CrylC delta-endotoxin, CrylC.579; insecticidal activity; control; insect; Lepidoptera; Spodoptera exigua; Plutella xylostella; Trichoplusia ni; Spodoptera frugiperda; PCR primer; 89.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCR primers AAV27859-60 were used in the course of the invention to create mutants of the CrylC delta-endotoxin of Bacillus thuringiensis. The mutant proteins show insecticidal activity, and can be sprayed onto plants or expressed in transgenic plants for the control of insects, particularly Lepidopteran pests such as Spodoptera exigua, Plutella xylostella, Trichoplusia ni and Spodoptera frugiperda
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New Bacillus thuringiensis nucleic acid segments - comprising delta-
endotoxin gene fragments, used for the control of insects, particularly
Lepidopteran pests.

The invention relates to an isolated CrylCa* delta-endotoxin polypeptide useful as an insecticide. Cry is a crystal protein from B. thuringiensis. The isolated CrylCa* delta-endotoxin polypeptide comprises: (a) one or more amino acid mutations in the loop regions between alpha helices 4 and 5 of domain 1; (b) one or more amino acid mutations in the loop regions between alpha helices 6 and 7 of domain 1; or (c) has improved activity against Lepidopteran insects relative to a native CrylCa* delta-endotoxin polypeptide is useful as an polypeptide. The CrylCa* delta-endotoxin polypeptide is useful as an insecticide, particularly for killing Lepidopteran insects or insect cells. The present sequence is a mutagenic PCR primer used to produce a mutant CrylC protein of the invention
                                                                                                   The present invention relates to novel transgenic plants comprising Cryl delta-endotoxin genes, in particular crylC genes that encode modified crystal proteins having improved resistance to Lepidopteran insects. The plants that express the mutated CrylC delta-endotoxin crystal proteins are monocotyledonous (corn, wheat, oat, rice, barley, turf grass, pasture grass) or dicotyledonous (legume, soybean, cotton, fruit, berry, tree). The present sequence is a PCR primer which is used for mutagenesis of Bacillus thuringiensis CRYIC DNA. This sequence is used in the exemplification of the invention
Transgenic plants, comprises nucleic acid encoding CrylC delta-endotoxin polypeptide, has improved resistance to Lepidopteran insects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CRYIC; ss; delta-endotoxin; insecticide; PCR; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New delta endotoxin polypeptides, which are Lepidopteran-toxic polypeptides, useful as an insecticide, particularly for killing Lepidopteran insects or insect cells.
                                                                                                                                                                                                                                                                                                                                                                                                                             .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes isolated Bacillus thuringiensis CrylC delta-endotoxin polypeptides having: (i) at least one amino acid (aa) mutation in the loop region between alpha-helices 6 and 7 of domain 1; and (ii) better activity against Lepidoptera than the native CrylC. The polypeptides, possibly after activity in the digestive tract of insects, kills insect cells by formation of pores and disturbing cellular homeostasis. The polypeptides are used to control lepidopteran psets on homeostasis. (i) applied as a composition; or (ii) expressed in plants from heterologous nucleic acid (generating insect-resistant plants). They are more active against Lepidoptera than native CrylC. AAA08144 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a nucleic acid segment comprising a delta-
endotoxin gene encoding a Cryl crystal protein. The nucleic acid segment
is useful for a recombinant expression method to prepare a recombinant
polypeptide useful as bioinsecticides. The present sequence is a PCR
primer used to amplify Crylc DNA
                                                                                                                                                                                                                Delta-endotoxin gene; Cryl crystal protein; bioinsecticide; transgenic;
                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid segment comprising a delta-endotoxin gene encoding a Cryl crystal protein, useful for a recombinant expression method to prepare a recombinant polypeptide useful as bioinsecticide.

                                                                                                                                                                                                                                                             The present invention describes a method of diagnosing the presence of, or susceptibility to, retinal dystrophy, cardiomyopathy, endocrinopathy, cor susceptibility to, retinal dystrophy, cardiomyopathy, endocrinopathy, diabetes, or Alstrom syndrome in an individual. The method comprises cregion of the individual, or detecting aberrant ALMS1 sorting in a sample from the individual, or detecting aberrant ALMS1 activity. Human capability or capability to 2ph3. ALMS1 has ophthalmological, cardiant, antidiabetic, hepatocropic and nephrotropic activities, and can be used in gene therapy. The method is useful for activities, and can be used in gene therapy. The method is useful for cardiomyopathy, endocrinopathy (e.g. liver disease or renal impairment), cardiomyopathy, endocrinopathy (e.g. liver disease or renal impairment), cused in an agent that prevents or treats retinal dystrophy, cardiomyopathy, endocrinopathy or diabetes is useful in manufacturing a cardiomyopathy, endocrinopathy or diabetes is useful in manufacturing a cardiomyopathy, endocrinopathy or diabetes is useful in manufacturing a cardiomyopathy, endocrinopathy or diabetes. Cc medicament for treating apatient who has been diagnosed as having or diabetes. ACF42632 to ACF42747 and ABR82113 to ABR82118 represent invention

The invention relates to determining genetic merit of a bovine with respect to milk composition and volume and involves determining the GHR crespect to milk composition and volume and involves determining the GHR growth hormone receptor) genotypic state of the bovine. The genotypic state is determined by the presence of at least one nucleotide difference from the nucleotide sequence, genomic and cDNA encompassing the bovine GHR gene selected from AD103978-AD103981, or by the presence of one or GHR gene polymorphisms comprising Nr 7185 (del 1), Nr 71-12 (T-C), Nr 864-33 (T-G), Nr 934-21 (A-G), Nr 1922 (C-T), Nr 1055 (C-T), Nr 1635 (C-T), Nr 1646-33 (T-G), Nr 934-51 (A-G), Nr 1922 (C-T), Nr 1583 (Nr 164) (T-C), Nr 164-33 (T-G), Nr 1922 (C-T), Nr 1583 (Nr 164) (T-C), Nr 164-33 (T-G), Nr 1922 (C-T), Nr 1583 (Nr 164) (T-C), Nr 164-33 (T-G), Nr 1922 (C-T), Nr 1583 (Nr 164) (T-C), Nr 164-33 (T-G), Nr 1922 (C-T), Nr 168-61 (T-C), Nr 164-33 (T-G), Nr 1922 (C-T), Nr 168-61 (T-C), Nr 164-33 (T-G), Nr 1922 (C-T), Nr 168-61 (T-C), Nr 164-33 (T-G), Nr 1922 (C-T), Nr 168-61 (T-C), Nr 164-33 (T-G), Nr 1922 (C-T), Nr 168-61 (T-C), Nr 164-33 (T-G), Nr 1922 (T-G), Nr 1923 (Nr 164-31) (T-C), Nr 164-33 (T-G), Nr 1922 (T-G), Nr 198-3 (Nr 164-31) (T-C), Nr 164-33 (T-G), Nr 1922 (T-G), Nr 198-3 (Nr 164-31) (T-C), Nr 164-33 (T-G), Nr 1922 (T-G), Nr 198-3 (Nr 164-31) (T-C), Nr 164-33 (T-G), Nr 198-3 (T-G), Nr 198-3 (Nr 164-31) (T-C), Nr 164-33 (T-G), Nr 198-3 (T-G), Nr 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Determining genetic merit of a bovine with respect to milk composition and volume comprises determining the GHR genotypic state of the bovine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                   The present invention relates to human nucleic acid sequences (I, ADO15739-ADO15912) obtained from 4 synthesis-period (stage 4S) of neuroblastoma cell. (I) is useful for prognosing and determining th progress stage of 4 synthesis-period of neuroblastoma. The present sequence is a primer, used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Otsuki T, Wakamatsu A, Sato H, Ishii S;

This sequence represents a PCR primer for a S. aureus polynucleotide of the invention. The invention also relates to the polypeptides encoded by the S. aureus polynucleotides. The polypeptides can be used for the treatment or prevention of disease. The polypeptide or polynucleotide can
                                                             The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM6502-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents an oligonucleotide used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S. aureus infection, diagnosis, therapy, central nervous system disorder; upper respiratory tract infection, otitis media; bacterial tracheitis; acute epiglottitis, thyroiditis; empyema; lung abscess; splanta bascess; cardiac infection, infective endocarditis, secretory diarrhoea; ulcer; retroperitoneal abscess; cerbral abscess; blepharitis; conjunctivitis; karatitis; endophthalmitis; preseptal cellulitis; orbital cellulitis; darryoyatitis; ppididymitis; interarenal abscess; perinephric abscess; toxic shock syndrome; impetigo; folliculitis; cutaneous abscess; cellulitis; wound infection; bacterial myositis; septic arthritis; one contemplation of the contemplatic abscess; cellulitis; Helicobacter pylori infection; stomach cancer; gastritis;

also be used to diagnose diseases related to their expression. The polypeptides and vectors containing them can also be used in immunisation methods. The products can be used for treating infection, e.g. infections of the upper respiratory tract, (e.g. otitis media, bacterial trachetis, contential, products acute epiglottitis, thyroiditis), respiratory (e.g. empyema, lung acute epiglottitis, thyroiditis, respiratory (e.g. empyema, lung secretory diarrhoea, splenic abscess), extroperitioneal abscess), central conjunctivitis, keratitis, endophthalmitis, preseptal and orbital conjunctivitis, intrarenal and perinphric abscess, toxic shock syndrome), epididymitis, intrarenal and perinphric abscess, toxic shock syndrome), skin (e.g. impetigo, folliculitis, cutaneous abscesses, cellulitis, wound infection, bacterial myositis), bone and joint (e.g. septic arthritis, osteomyellitis), or Helicobacter pylori infections, (e.g. causing stomach cancer, ulcers and gastritis). The products can also be used for treating in-dwelling devices and wounds
                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is a PCR primer used in the cloning of the T66Bk gene. The invention related to a nucleic acid molecule (I) comprising a transcription unit encoding in its 5' portion a kinase having a homology to MARK2 kinase and the 3' portion of the nucleotide sequence has a high homology to rsk3 kinase. Sperm produced by transgenic creatures containing (I) are useful for production of offspring. T66Bk, its regulatory region, recombinant DNA, vectors, host cells, antibodies, etc., are useful for the isolation of receptors on the surface of sperm recognising attractants of the egg cell for the development and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Transcription unit; MARK2 kinase; rsk3 kinase; regulatory region; T66Bk; contraceptive; Responder/Distorter signalling cascade; t-Responder;
